

VeloCloud Services Reliability, Resiliency and Security

VeloCloud Cloud-Delivered SD-WAN incorporates a distributed network of service gateways and SD-WAN orchestrators deployed at top tier cloud datacenters around the world, providing scalability, redundancy and on-demand flexibility.

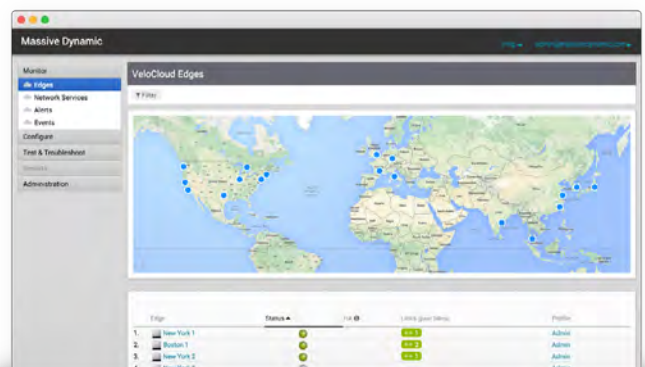

VeloCloud service gateways and orchestrators enable optimized data paths for all applications, branches and data centers along with the ability to deliver network services from the cloud. Eliminate datacenter backhaul penalties with a cloud-ready network to provide an efficient direct path to public and private enterprise clouds. Enterprises get unmatched flexibility to decide what services to deploy and manage, when to upgrade and adhere to network operation policies.

Availability and Uptime

- 99.99% uptime service level agreement, 24x7 automated failure detection
- Global infrastructure of datacenters for optimal selection and redundancy
- VeloCloud Orchestrator is not in the data path, nor required for ongoing flow control
- Management continuity is provided with failover Orchestrators and regular backups
- Active-active Gateways provide sub-second resiliency for VPN traffic
- Additionally, SaaS traffic can also failover to bypass Gateways
- Scheduled maintenance windows are advertised 72 hours in advance, and Edge upgrade windows are deferrable with times requested by account holder
- Cloud connectivity does not impact customer network operations

Cloud Datacenters

- Co-located in Tier IV SSAE 16 Type II certified datacenters
- ISAE-3402 (SAS70 / SSAE16 Replacement) certified facilities & providers for reliable and failover design to ensure uninterrupted service in the event of a catastrophe
- Each datacenter serviced by multiple providers and multiple locations
- Meets the requirements of International privacy controls and compliant with European safe harbor type policies

Redundancy and Disaster Recovery

- Customer network data (system and configuration data) replicated across multiple datacenters with regular backups
- Well-documented, rapid response operation teams across multiple locations
- All datacenters serviced by multiple top-tier carriers
- Rapid failover to backup system in the event of hardware failure or external factor

Robust Physical Infrastructure

- Controlled physical access with onsite 24x7 security, CCTV coverage and biometric access controls with mantraps
- N+1 UPS with a minimum of 5 minutes of reserve power at full datacenter load. N+1 redundant generators with onsite fuel for a minimum of 36 hours
- Blended Transit with a minimum of 10Gbps capacity and facilities are selected to be near or at IX locations with dense participation
- Precision cooling system providing temperature, air-flow and humidity controls
- Early fire detection with isolated and fast suppression response

Network Infrastructure and Security

- Secure account separation for multi-tenant Orchestrator and Gateways
- Strong firewall policies to deny access for malicious traffic from public networks
- Proactive monitoring, regular vulnerability scans and penetration tests performed by reputable service provider, and automated notifications
- Management network communications protected by industry-standard encryption algorithms and security protocols
- Multi-factor authentication for administrative remote access
- Configuration change monitoring and access audits for production network

Account Protection and Privacy

- Accounts are password protected and accessed via SSL
- Granular user, role-based access controls and policy framework helps to manage 3rd party access
- Monitoring and incident response procedures in all locations with 24x7 standby teams
- No data traffic is captured nor stored unless enabled by customer with packet capture feature
- User and host machine information is only available to administrators selected by account holder

VeloCloud Networks, Inc., the Cloud-Delivered SD-WAN™ company and winner of Best Startup of Interop, simplifies branch WAN networking by automating deployment and improving performance over private, broadband Internet and LTE links for today's increasingly distributed enterprises.
